

How to extract slices on the MPC Live 1/2/X

New Sample to Pad

Treats only one slice. The command creates a new sample from the slice, crops it if the box is ticked, and assigns it to the chosen pad in the chosen program.

Assign Slice to Pad

Treats only one slice. As opposed to **New Sample to Pad** this command does not create a new sample. Instead the new program refers to the slice in the original sample using two different ways:

- o **Non-Destructive Slice**: The target program refers to the slice number in the source sample. If you change the position of the slice in the source sample, the position in the target program will change as well.

- o **Pad Parameters**: The target program does not refer to the slice number but instead takes the start- and endpoints and refers to them. If you alter the slice in the source sample the target program will not be affected.

New Program With New Samples

Treats all slices. Generates new samples for each slice and assigns them to pads in a new drum program. The program-name will end on **_ch**, the new samplenames end on **SI-#**.

If you don't check the **Create Program**-Option the samples will be placed in memory but not assigned to a new program.

You can also generate a phrase from your slices by checking the **Create Events**-Option.

New Drum Program Using Slices

Treats all slices. Does not create new samples but refers to the slices in the sample of origin. Again, like **Assign Slice to Pad**, two referral modes are available:

- o **Non-Destructive Slice**: The target program refers to the slice numbers in the source sample. If you change the slice-position in the source sample you also change the slices in the new program.

- o **Pad Parameters**: The target program referst to the start- and endpoint of the slice in the source sample. You can change the slice in the source sample without effecting the target program.

New Clip Program

Creates a new clip program from the slices. Useful for slicing songs and remixing them.

Patched Phrase

Creates a patched phrase from the slices. A patched phrase is AKAs equivalent to Propellerheads **REX**-Format.
